The following is an examiner's statement of reasons for allowance:

Dalton 2002/0006837 requires the polybutadiene to have a MW > 200,000 (paragraph 91) and a low vinyl content (paragraph 90). Aoki requires a MW < 100,000 (col 3 line 13) and a high vinyl content (>40% col 2 line 57). It would not have been obvious to use Aoki's initiators as a substitute for Dalton's peroxides because it is not clear such initiators would be effective for the different polybutadienes.

Similarly, Higuchi '692 prefers 1,4-polybutadiene of at least 40% cis structure. This would not permit the high amount of vinyl content (ie 1,2 polybutadiene) that Aoki teaches is necessary for his initiators to be effective. Sullivan '403 (col 30 line 21) and Harrison '721 (col 1 line 72) call for high cis polybutadiene which is at odds with the vinyl requirements of Aoki. Furthermore, Harrison prefers a MW of >200,000 (col 2 line 2).

The Voorheis opinion declaration reinforces the idea that the high vinyl content polybutadienes Aoki deems necessary for his initiators would not make useful golf balls.

Amtmann does not teach his initiators are useful for any polybutadiene.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
